New features

Summary	Short Description
Hardware IDs included in BP license are displayed	The FirstSpirit Integration Administration iView now displays all Hardware IDs covered by the license in a table. Also, the Hardware ID of the currently displayed instance can be better identified than in previous versions.
MixedPortalPage can be created as delta link based on any page template	It is now possible to configure the portal page template on which a Mixed Portal Page is based. This gives you the option to use custom page implementations with custom layouts.
New templates used for MixedPortalPages and FSIntegration iViews	By default, MixedPortalPages are now based on the SAP page template "Default Page Template" instead of its - previously used - source object. FSIntegration iViews are now based on a new iView instance ("HLP URL iView") inside the "Released Content" folder instead of its - previously used - source object "HLP URL iView Template".
Removal of legacy properties from FSIntegration iView	The FSIntegration iView had some properties defined (in portalapp.xml) that are no longer used.
iViews can be rendered in isolation mode "EMBEDDED"	BP iViews (Navigation URL iview and FSIntegration iView) with the SAP property "IsolationMode" set to "Embedded" are now capable of displaying the FS content in such a way that no surrounding iFrames appear. This feature can only be applied successfully when the FirstSpirit project has been designed accordingly and a suitable (=frameless) Portal Framework is used.
iViews/pages inside a MixedPortalPage can have differing role permissions	Permissions that have been defined on sections (=iview/pages) of a MixedPortalPage are now transported into the Portal. As a result, a MixedPortalPage can now display some iViews/pages for one user group (=role) and hide others from another user group.

6 issues

Fixed bugs

Summary	Short Description
Status of search XML processing is empty when directly executed	It was not possible to monitor the progress of a directly executed Search XML update in KM. This bug has now been fixed.
