New features

Summary	Short Description
Removal of SharingReference to "com.sap.portal.productivity.dom"	Both the BP application "de.hlp.pct.fsintegration" and the search component "de.hlp.pct.km.fsintegration" defined a runtime reference to the SAP application "com.sap.portal.productivity.dom" which is no longer available starting from NW 7.5 SPS 7. The reference was now removed from the BP and the search component.

1 issue

Fixed bugs

Summary	Short Description
FIRSTspiritWeb filters cause WebIllegalStateExceptions error messages	FIRSTspiritWeb contains two servlet filters for securing html content pages and media. Both filters caused WebIllegalStateExceptions in the log file when access to a resource was denied or redirection to an error page took place. This bug was now fixed.
Search XML cannot be directly executed with non-Administrator user	When the direct execution of a search entry point was called with a service user (i.e. not "Administrator") the processing was denied with the exception "User: fsuser has not permission: vpName: default, type: queue, action: produce, destination: ProcessSearchXml". This behaviour is caused due to lacking permissions (starting from NW 7.4 SPS 12 and NW 7.5). A chapter has been added to the documentation of the Search Component to describe which permissions need to be granted to the service user.
